

SkyFile Mail – Sending SMS messages

1. Click on **Send SMS** button (or go to **Message > Send SMS...** from the menu options)

2. a) Add destination mobile number (including country code) in the **To:** field (for example: +614..... for an Australian mobile)
b) Type SMS message in the **Message:** field

3. Click **Send** once message is ready to be sent

4. Once a SMS message is written and “Sent” and appears in the Message List marked in red (or in the Outbox via “Split” view), your message in reality has not yet been transmitted via satellite. For an immediate, manual data exchange, click on the **Dial now** button (or go to **File > Dial now...** from the menu options). All messages marked in Red (Message List) or in Outbox (Split View) are queued to be sent, pending a satellite data connection
